Helsinki, 7-11 October 1991

VOLUME MEASURES FOR INSURANCE AND PENSION FUNDING

Tuomas Rothovius and Seppo Varjonen  
Central Statistical Office of Finland

## Introduction

Insurance and pension funding belongs to those service activities in the national accounting where no self-evident method can be found for measuring the output in real terms. Practices differ country by country.

In the national accounting of Finland, the measurement of the insurance output is based on aggregation of volumes of individual insurance branches. However, the method applied has often led to difficulties. Partly the difficulties are due to the definition of insurance output in the present SNA where it is stated that the output does not include incomes from investments. The draft SNA 1993 accepts these incomes into production but, of course, this will solve only a small share of measuring problems.

The purpose of the present paper is to highlight problems in measuring the volume development of insurance and pension funding. The tests are based on the statistics available for annual national accounting.

## Insurance business in Finland

In Finland it is a common usage to divide the insurance business into non-life insurance, life assurance and pension insurance. Non-life insurance and life assurance corresponds to usual international practice. As regards the pension insurance, it is organized in Finland differently compared to most other countries. The Finnish system consists of the national pensions scheme and of the employment pensions scheme.

Non-life insurance is transacted by insurance companies (which are limited companies or mutual companies) and insurance associations (which are small local institutions dealing mainly with fire insurance). Insurance companies transacts life assurance and, worth noticing, pension insurance, too. Furthermore pension insurance is transacted by pension funds and pension foundations and some special pension institutions for certain worker groups.

The Social Security Institution, which is classified into the compulsory social security, is responsible for the national pensions insurance and compulsory sickness insurance. The unemployment insurance is arranged via the unemployment funds scheme, where benefits are channelled through The Social Security Institutions.

### Output at current prices

When calculating the current production account for the insurance, the aim here was to follow the recommendations of the draft SNA 1993. The calculations cover the years from 1980 until 1987 in which period the base statistics from insurance companies were available in the same form.

There are two output tables at current prices in the appendix. In Table 1 the net income from investments is presented separately for both non-life insurance and life assurance and pensions funds. In Table 2 the income has been distributed to various insurance branches.

Data from the non-life insurance and life assurance was collected by insurance branches. The output of each insurance branch (in Table 2) is obtained from the following formula:

$$\text{PI-CPR-C-CCR+NII}$$

where  
 PI = Premium income  
 CPR = Change in premium reserve  
 C = Claims paid  
 CCR = Change in claims reserve  
 NII = Net income from investment

Premium income is registered to counting period by subtracting the change in premium reserve from premium income. Claims are registered according to the accounting period the event insured takes place. The net income from investment does not include income from equity capital. Also the increases and decreases in value on investments are excluded.

The output of the pension funds ('Statutory employment pension insurance' and 'Voluntary pension insurance') are accounted as a sum of administration costs of these insurance companies, pension funds and foundations. Figures do not include the national pension which belongs to the social security funds.

The item 'Other' is mainly composed of minor foundations which are supplementary to the pension funds (compiled as a sum of administration costs) and insurance associations (compiled in the 'normal' way by subtracting claims from premiums).

Intermediate consumption consists of two parts, out-going reinsurance premiums minus claims and other intermediate consumption.

### Measuring the output at constant prices

In most countries the output of insurance and pension funds in real terms is measured by deflating the current accounts by an appropriate index or indices. What indices are chosen or how they are applied (single deflation, double deflation, deflation of costs, etc.) differ greatly. Results based on the use of these methods can hardly be interpreted to reflect "real volumes" of the insurance output.

It is obvious that the only way to approach the real output of insurance services is to base the calculation on detailed types of insurance services. In other words, the volume is calculated for each insurance branch and then the results are aggregated. For the pension funding the deflation of the administration costs seems to be a natural alternative having in mind the recommendation of the draft SNA to calculate the current output on the basis of costs.

### Calculation of volumes for the insurance branches

A crucial question in the analysis by detailed insurance branches is whether the volumes of the insurance branches should be based on the number of policies (or some other volume indicator) when this information is available or should we use an appropriate price index for each branch.

The main problem in using volume indicators, is well-known. Can we assume that the insurance policies are homogeneous enough to be applicable for a volume indicator?

The application of the deflation method means that the sum PI-CPR+NII is deflated by a feasible price index. By this solution, as can be concluded from the formula of the gross output, increase or decrease of claims has influence on the price of output, not on volume. In other words, the implicit deflator of the output consists of two components, an appropriate price index and change in the share of claims of premiums (or in fact 'premiums minus claims' to 'premiums').

The volume indicators and deflators applied in this exercise are described in the annex as well as the numerical results. The results are presented also graphically.

There is no self-evident solution for each insurance branch. The results of Table 3 represent a solution, where a volume indicator has been chosen, whenever the homogeneity seems to be high enough. The indicator is in most cases the number of insurance policies but also indicators based on deflation of sum of insurance have been included in this group.

The Table 4 represent a solution where only deflation methods has been applied for insurance branches.

Table 5 is a combination of the results of the tables 3 and 4. In fact, in this base alternative, the volume indicator was accepted for each insurance branch with only one exception. The deflation method is perhaps more appropriate for the statutory accident insurance. The premiums are paid by all employees as a fixed percentage of wages and salaries.

#### Volume based on chaining

The insurance activity is a fast changing production sector. The output of certain branches may even be negative in some years. Therefore it is interesting to test the dependency of results on the base year of the calculation. The tests were made in two ways, by carrying out the calculations by having other base years (1984 and 1986), and by applying the chaining method.

The tests revealed that the change of the fixed base year to 1984 or 1986 (results not presented here) did not have much impact on results, but the same was not true for the chaining method.

The chaining was done by accepting in the calculation only the growth rates of those insurance branches where the output was positive in the former year. The results are presented in Table 6 where it can be seen that the growth rate by this method is very low resulting a negative average growth for the value added.

#### Conclusions

The tests made are yet preliminary by nature. However, the results clearly indicate that this kind of analysis is worthwhile to be continued. On the other hand, one can not be too optimistic and expect finding a volume measure which could be held unchanged a long time.

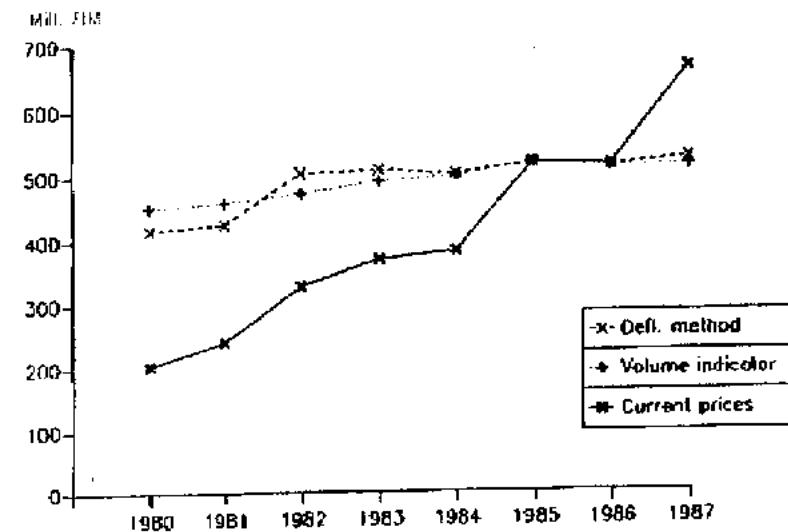

## **ANNEX**

## Measurement of volume for insurance branches

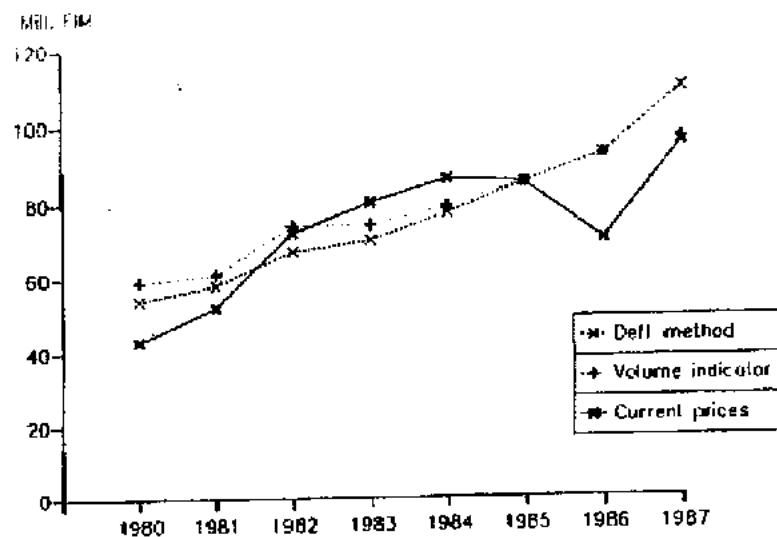

<u>Branch</u>	<u>Deflator</u>	<u>Volume indicator</u>
1. Statutory accident insurance	wage and salary index of all w. and s. earners	sum of wages and salaries in the economy deflated by the w. and s. index of all w. and s. earners
2. Other accident insurance	same as (1)	number of ins. policies by sub-branches, weighted by premium income
3. Compulsory motor vehicle insurance	index of car repair costs	number of ins. policies, weighted by the average price of various types of vehicles
4. Other motor vehicle insurance	same as (3)	same as (3)
5. Hull insurance	price index for ships and boats	number of ins. policies by sub-branches, weighted by premium income
6. Cargo insurance	wholesale price index	none
7. Fire insurance	building cost index	number of ins. pol. by sub-branches, weighted by premium income
8. Combined fire insurance	same as (7)	same as (7)

9. Loss of profit insurance	wholesale price index	sum insured deflated by wholesale index
10. Forest insurance	price index for timber	number of ins. pol. by sub-branches, weighted by premium income
11. Third party insurance	wholesale price index	none
12. Credit insurance	wholesale price index	sum insured deflated by wholesale index
13. Live stock insurance	index for slaughter value	sum insured deflated by slaughter value index
14. Other insurance	wholesale price index	number of ins. pol. by sub-branches, weighted by premium income
15. Reinsurance	wholesale price index	none
16. Life assurance	cost index: weighted average of wage and salary index for insurance and index for intermediate consumption	sum insured deflated by consumer price index
17. Employee's group life assurance	same as (16)	same as (16)
18. Statutory employment pension insurance	same as (16)	none
19. Voluntary employment pension insurance	same as (16)	none
20. Reinsurance	wholesale price index	none
21. Other	same as (16)	none
